

Getting started with

Vue.js

The goal of the presentation

- Overview over Vue ecosystem
- Inspire participants to start learning Vue
- Be able to create very basic vue application

SPA

- A **single-page application (SPA)** is a web application or web site that interacts with the user by **dynamically rewriting the current page rather than loading entire new pages from a server**. This approach avoids interruption of the user experience between successive pages, making the application behave more like a desktop application.

What is Vue.js?

- Vue means view in French. “View” was already used a lot but the french Vue was available.
- Vue.js is a JavaScript framework that competes with Angular and React.
- It consists of an approachable core library that focuses on the view layer only, and an ecosystem of supporting libraries that helps you tackle complexity in large Single-Page Applications.
- Vue.js is an MIT-licensed open source project. Not tied to any company.

Benefits of Vue.js

- Easy to understand as long as you know basic HTML, CSS, and JavaScript.
- It's incredibly versatile and works with a wide variety of other web technologies.
- It's one of the smallest and fastest frontend JavaScript frameworks.
- Vue Components are very easy to understand with excellent organization.
- Vue is reactive.
- The Vue documentation is really good.
- The built in transition & animation system.

Comparison

When to choose React or Vue		
If you:	 React.js	 Vue.js
Like flexibility	✓	✓
Like large ecosystems	✓	
Love JS and the all-is-javascript approach	✓	
Like really clean code	✓	✓
Want the simplest learning curve		✓
Want the most lightweight framework		✓
Want a division of responsibility within one file		✓

**There are four ways to get up and
running with Vue**

1a

Using Vue through a CDN:

```
<!-- development version, includes helpful console warnings -->  
<script src="https://cdn.jsdelivr.net/npm/vue/dist/vue.js"></script>
```

or

```
<!-- production version, optimized for size and speed -->  
<script src="https://cdn.jsdelivr.net/npm/vue"></script>
```

or

```
<!-- linking to a specific version to avoid unexpected breakage from newer versions -->  
<script src="https://cdn.jsdelivr.net/npm/vue@2.6.10/dist/vue.js"></script>
```

index.html

1b

```
<body>

  <div id="app">
    {{ message }}
  </div>

  <script src="https://cdn.jsdelivr.net/npm/vue/dist/vue.js"></script>
  <script>
    var app = new Vue({
      el: '#app',
      data: {
        message: 'Hello Vue!'
      }
    })
  </script>
</body>
```

2

Install Vue using NPM:

```
# latest stable  
$ npm install vue
```

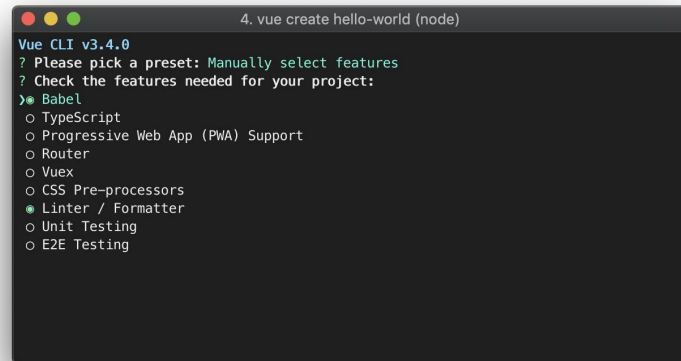

3

Install Vue using the Vue CLI:

```
$ npm install -g @vue/cli
```

Start a new Vue project:

```
$ vue create my-project  
$ npm run serve/yarn serve
```

Use Vue CLI for quickly scaffolding ambitious Single Page Applications. It provides batteries-included build setups for a modern frontend workflow. It takes only a few minutes to get up and running with hot-reload, lint-on-save, and production-ready builds.

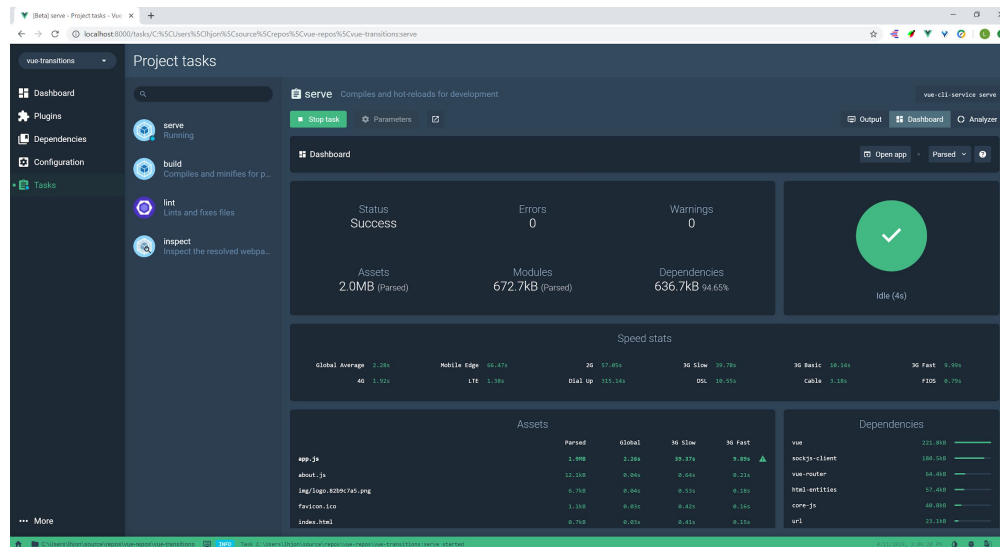

4

Install Vue using the Vue CLI:

```
$ npm install -g @vue/cli
```

Start a new Vue project:

```
$ vue ui
```

Directives

Directives are special attributes with the v- prefix. Directive attribute values are expected to be a single JavaScript expression (with the exception of v-for). A directive's job is to reactively apply side effects to the DOM when the value of its expression changes.

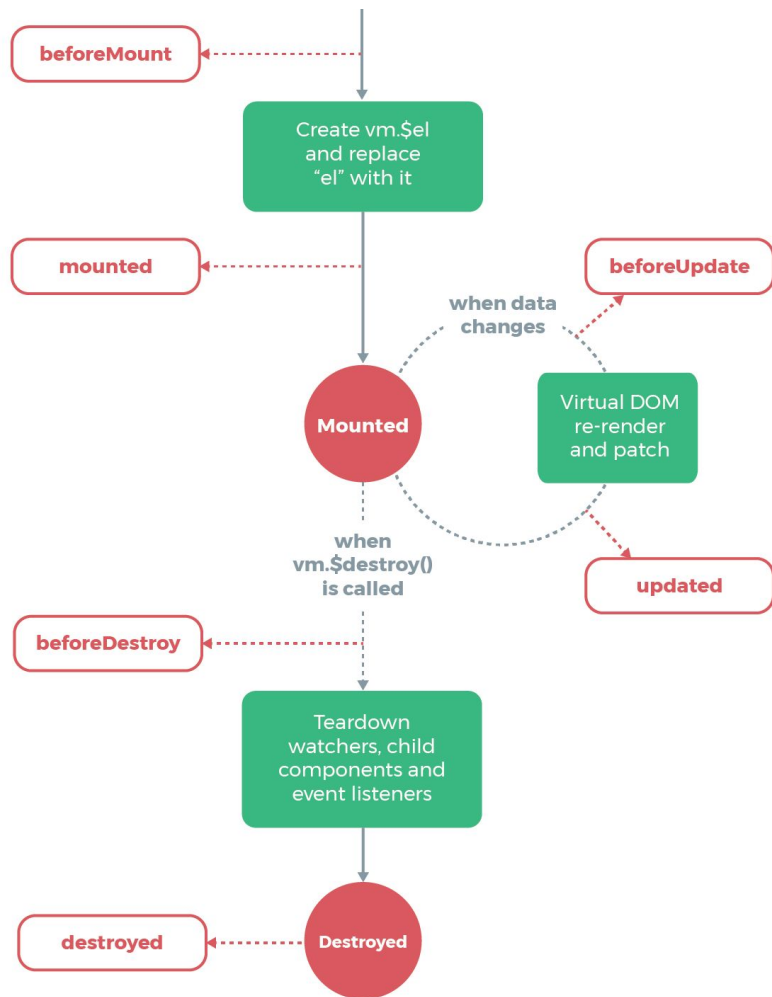

- v-if – used to conditionally render an element (v-show)
- v-for – iterate over a range, an array, an object, or an array of objects
- v-bind – when an expression changes so does the UI, :
- v-model - same as v-bind but both ways, for example input field that starts with a value (two way)
- v-on – listen to various DOM events (click, keyup, submit, etc.), @

Vue Core Libraries

Vuex

State management pattern + library for Vue.js applications

- Data
- Action
- Mutations
- Getters

```
const app = new Vue({  
  data: {  
    ...  
  },  
  methods: {  
    ...  
  },  
  computed: {  
    ...  
  }  
})
```

```
const store = new Vuex.Store({  
  state: {  
    ...  
  },  
  mutations: {  
    ...  
  },  
  actions: {  
    ...  
  },  
  getters: {  
    ...  
  }  
})
```

Vue Router

Vue Router is the official router for Vue.js. It deeply integrates with Vue.js core to make building Single Page Applications with Vue.js a breeze. Features include:

- Nested route/view mapping
- Modular, component-based router configuration
- Route params, query, wildcards
- View transition effects powered by Vue.js' transition system
- Fine-grained navigation control
- Links with automatic active CSS classes
- HTML5 history mode or hash mode, with auto-fallback in IE9
- Customizable Scroll Behavior

Vue Router Install

- **CDN**

Latest: <https://unpkg.com/vue-router/dist/vue-router.js>

Specific version: <https://unpkg.com/vue-router@2.0.0/dist/vue-router.js>

Include vue-router after Vue and it will install itself automatically:

```
<script src="/path/to/vue.js"></script>
```

```
<script src="/path/to/vue-router.js"></script>
```

- **NPM**

```
npm install vue-router
```

- Use **Vue CLI** or **Vue UI**

Transitions and Animations

Vue provides a variety of ways to apply transition effects when items are inserted, updated, or removed from the DOM.

Vue will help you to:

- Automatically apply classes for CSS transitions and animations.
- Integrate 3rd-party CSS animation libraries.
- Use JavaScript to directly manipulate the DOM during transition hooks.
- Integrate 3rd-party JavaScript animation libraries.

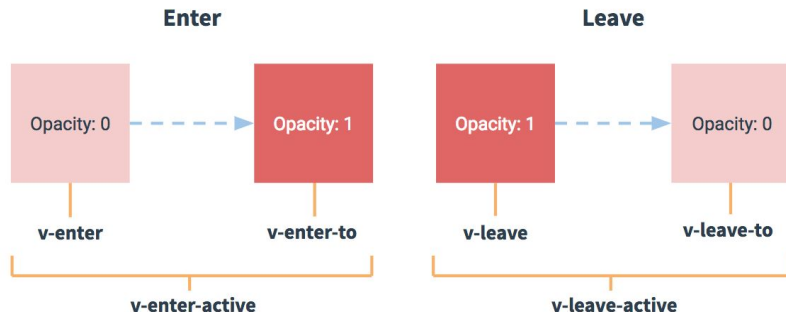

Enter/Leave & List Transitions

When an element wrapped in a `<transition>` component is inserted or removed. The following happens:

1. Vue will automatically sniff whether the target element has CSS transitions or animations applied. If it does, CSS transition classes will be added/removed at appropriate timings.
2. If the transition component provided JavaScript hooks, these hooks will be called at appropriate timings.
3. If no CSS transitions/animations are detected and no JavaScript hooks are provided, the DOM operations for insertion and/or removal will be executed immediately on next frame (Note: this is a browser animation frame, different from Vue's concept of `nextTick`).

Transition Classes

1. **v-enter:** Starting state for enter. Added before element is inserted, removed one frame after element is inserted.
2. **v-enter-active:** Active state for enter. Applied during the entire entering phase.
3. **v-enter-to:** Ending state for enter.
4. **v-leave:** Starting state for leave. Added immediately when a leaving transition is triggered, removed after one frame.
5. **v-leave-active:** Active state for leave. Applied during the entire leaving phase.
6. **v-leave-to:** Ending state for leave

Nuxt.js

The Vue.js framework for:

- Server Side Rendered (Universal)
If Search Engine Optimization is important.
- Statically Generated (Pre-Rendering)
If Search Engine Optimization is important.
- Single Page Application (SPA)
Example of a [SPA application](#) using Nuxt.js.
- Nuxt.js is Vue.js equivalent to React's Next.js.

Exercise

- Pairs
- Clone repo, see mail

Exercise

- Gör egen component av listan
- Skriv en egen drop down istället för att använda select
- Använd list watcher i Autocomplete till något vettigt
- Lägg in en router
- Lägg in en animation
